

Abstract of the Disclosure

In a stub search loading system for, in
executing remote method invocation from a plurality of
clients to a server, downloading a stub necessary in a
request source client from the server, the request
5 source client includes a stub search section, and the
server includes a stub search interface. The stub
search section sends a stub request formed from a stub
name and client identifier to the server and receives a
stub returned from the server. In response to the stub
10 request, the stub search interface returns to the
request source client the stub appropriate for the
runtime environment of the request source client on the
basis of the designated stub name and client identifier.
A stub search loading method, server apparatus, client
15 apparatus, and computer-readable recording medium are
also disclosed.
